

## Truss Jib

Truss Jib - A truss jib is actually utilized in order to carry and place trusses. It is actually an extended jib additional part that is outfitted together with a triangular or pyramid shaped frame. Usually, truss jibs are mounted on machinery such as a compact telehandler, a skid steer loader or even a forklift using a quick-coupler accessory.

Older style cranes that have deep triangular truss jibs are normally assemble and fastened with bolts and rivets into standard open structural shapes. There are rarely any welds on these kind jibs. Each riveted or bolted joint is susceptible to corrosion and therefore needs regular maintenance and check up.

Truss jibs are designed with a back-to-back arrangement of lacing members separated by the width of the flange thickness of an additional structural member. This particular design causes narrow separation amid the flat surfaces of the lacings. There is limited access and little room to clean and preserve them against corrosion. A lot of bolts become loose and corrode inside their bores and must be changed.
